

COLOR OF SPACE

CHILL DIVISION

THC: 24.5%

CBD: < 0.5%

CBG: ~1%

Yield: *Moderate*, 1.7-2lb/m2 indoors

Flowering time: 58-60 days

Medical uses: Calming, stress relief, antidepressant, anti-anxiety

Lineage: Slurricane x Platinum Kush Breath No.5 (Snow White Cut)

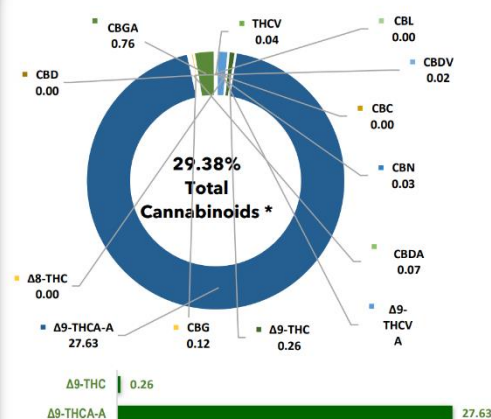

Cultivar overview:

A limited-edition collaboration between House_a_Heat and In-House Genetics, Color of Space was one of the most eye-catching cultivars to be released in 2022. With top-tier lineage it's no wonder it both packs potency and stunning looks. Sure to make any photographer salivate with such strong camera-ready appeal.

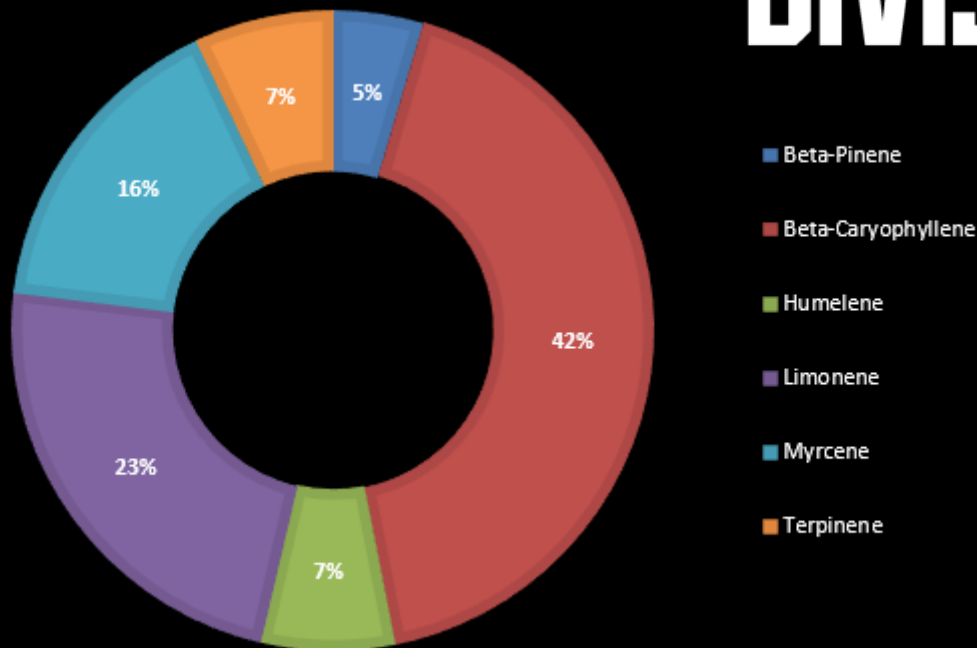

The aroma is sweet with candy notes and a hint of diesel.

Although Color of Space can be picky about the humidity, she is quite a resilient cultivar. A more advanced set of environmental controls is needed to fully bring out the maximum bag appeal, and truly appreciate the wonders that Color of Space has to offer.

CHILL DiViSiON

Terpene breakdown:

Taste / smell:

Color of Space inherits strong traits from both its' PKB and Slurricane parents, further compounding their delicious smells. With an uplifting cinnamon like smell dominating the palate, the sweetness is complimented with a slight citrus tinge reminiscent of tangerines. Rounded out with a nice and subtle diesel smell, Color of Space will no doubt appeal to a broad variety of consumers.

The taste is soft, and not overbearing. It still remains flavorful and attractive, predominantly from the heavy trichome coverage.

Effects:

The strong calming relaxation from Color of Space is of broad appeal to consumers, greatly complimenting the pain reduction. It is not overpowering, being deeply uplifting without a strong "couch lock" effect, and no major munchies either, permitting morning use without writing off an entire day.

The light sedative feeling has been described as a cozy blanket wrapped around the consumer. A giant hug and a warm embrace that will give you a positive outlook on life!

In addition to the dominant antidepressant, anti-anxiety and painkiller aspects, there are solid anti-inflammatory traits, suitable for gut and digestion inflammation alleviation, and may also be well poised for balms or other topical creams.

Cultivation notes:

Color of Space roots quickly provided the mother plant was well into generative growth when cuttings are taken, with some aeroponic cloners providing roots within as little as 4 days. The expectation of 7 days should be normal, and 10 days until vegetative growth is ramped up.

Color of Space grows quite short and stocky during vegetative growth and will greatly benefit from at least one topping approx 1 week prior to flowering. She likes a slightly lower VPD than most in order to maximize growth, so 0.9-1.0 will be your optimal region to see her thrive.

Where lateral space is limited, Color of Space is best given a shorter vegetative phase due to her very squat nature. The fan leaves will quick grow very thick, lush, and heavy, overshadowing lower growth.

During vegetative growth, Color of Space can mostly be left alone. However, when flipping to flowering, she benefits greatly from a really aggressive defoliation of lower branches. Further defoliation should be done when stretching finishes around the 22-24 day timeframe. Care must be given to maintaining pH balance, however hydroponically Color of Space has responded well with a broad range of nutrient EC levels.

Attention should be taken to ensure sufficient airflow, as both buds and sugar leaves will grow covered with dense trichomes that are renowned for being sticky and may glue to other colas if packed too tightly. Color of Space also often exhibits “rails” of trichomes along the edges of sugar leaves which causes them to curl in on themselves quickly when the humidity is too dry. When well-trained during the early phases of flowering, despite only being a moderate yielder weight-wise, she packs out very well. Consideration should be given to cola spacing and airflow, depending how tightly packed the expectations are.

Leaves may turn from a deep rich green to purple if a day-night temperature drop of approx 6-7C occurs. Finishing the last two weeks of flowering under 20C will ensure maximum trichome swelling, and further bring out the beautiful expression in Color of Space.
